EXP NO: 2 **Setting up a Zoho Creator account and exploring the platform architecture and interface.**

1] ZOHO ARCHITECTURE

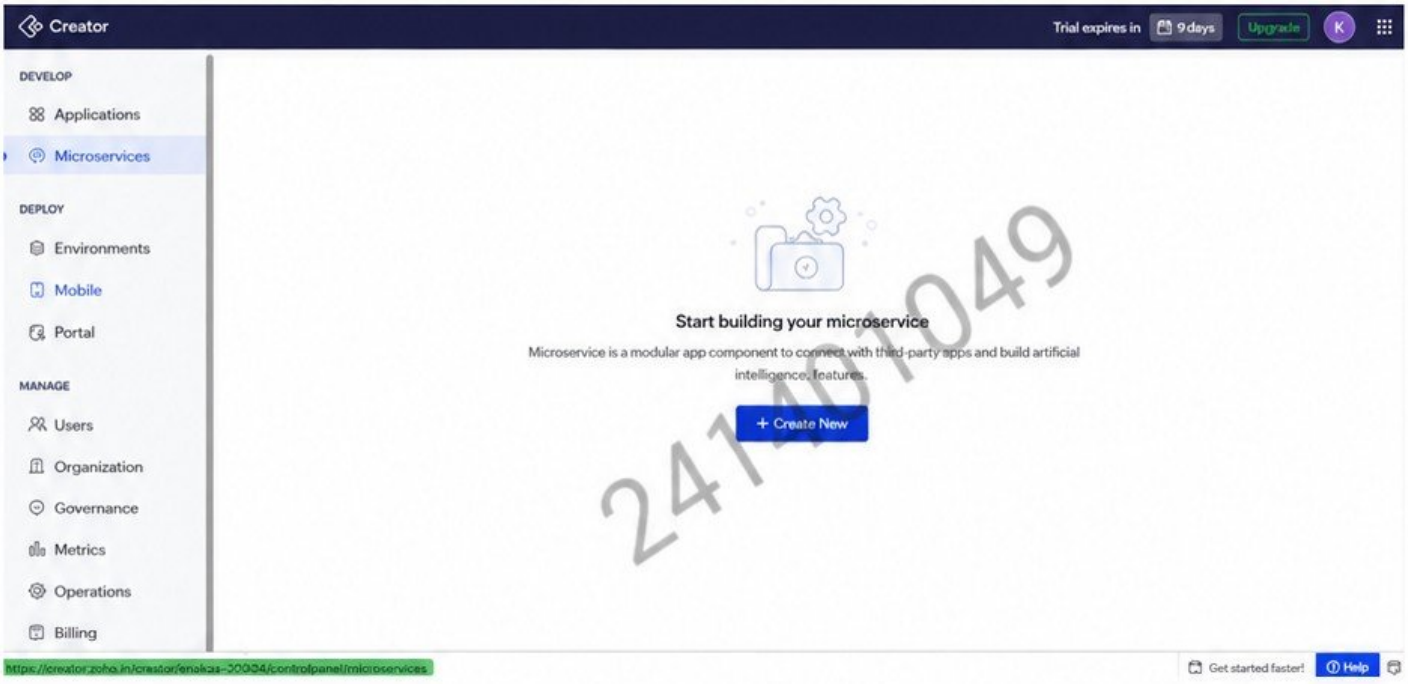

241401049

2) DEVELOP:(DESCRIPTIONs)

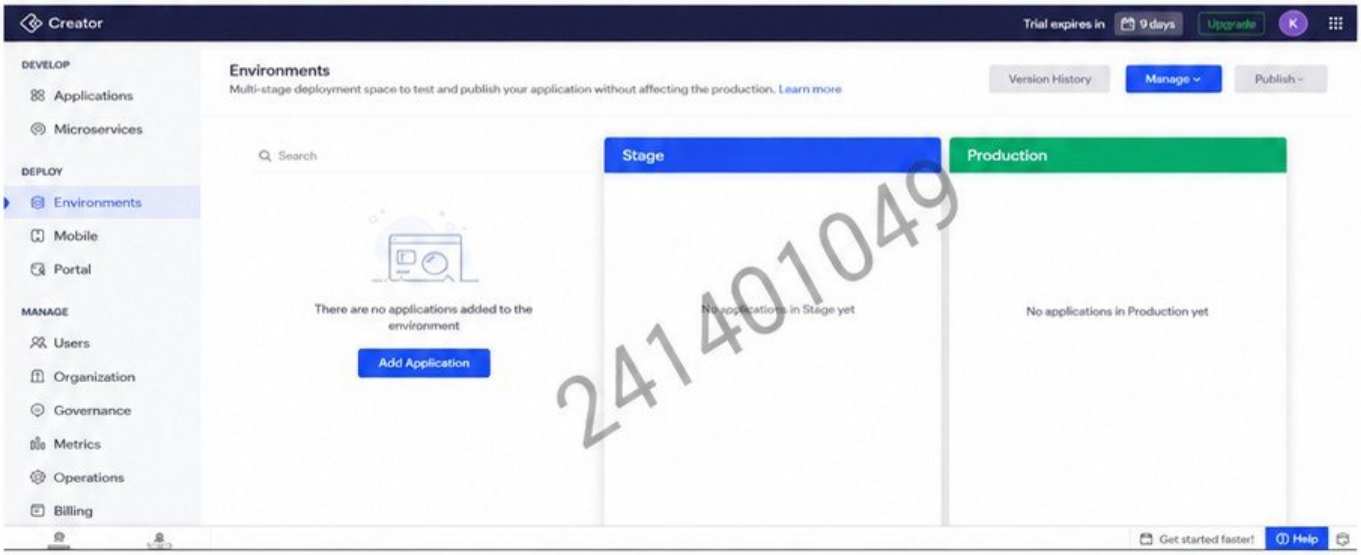

The Applications page in Zoho Creator serves as the central workspace for managing all applications within the organization. It displays the list of existing applications in a card-based layout, allowing users to quickly identify and access their projects. Each application card provides essential details, such as the application name and creation

date, along with options to open, edit, or manage the application. The page also includes a Create Application button, enabling users to build new low-code applications from scratch or using templates. Additionally, users can search, filter, and organize applications, making it easier to manage multiple projects from a single interface.

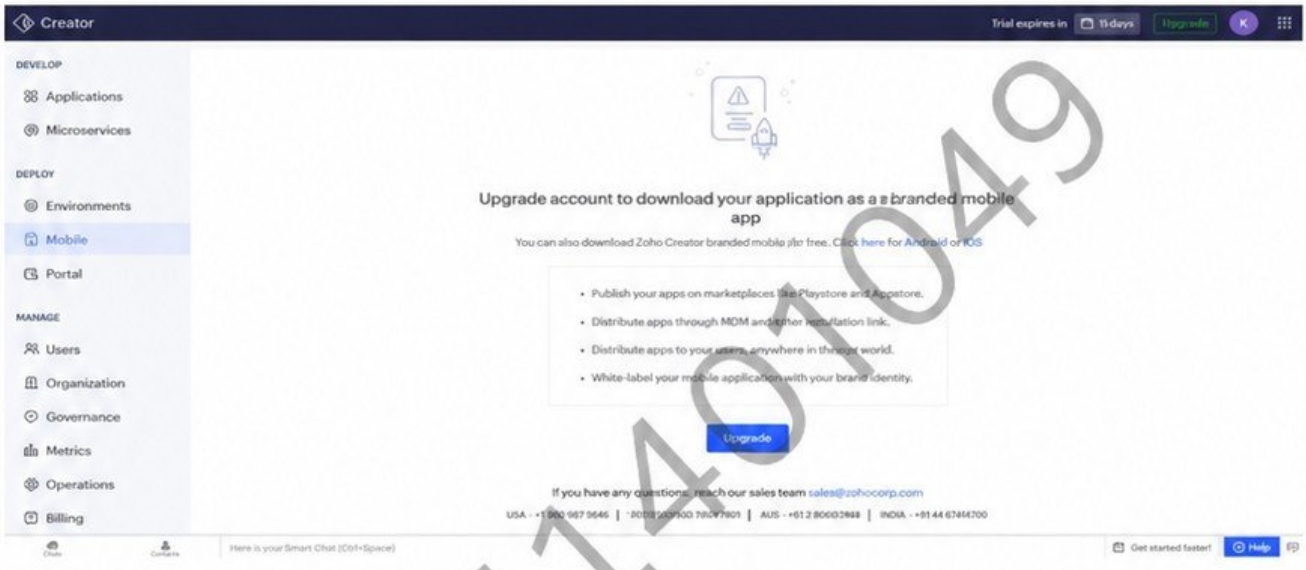

The **Microservices** page in Zoho Creator enables users to create and manage modular services that extend the functionality of applications through seamless integration with external systems and APIs. It provides a dedicated workspace for building reusable microservices that can perform specific tasks independently and communicate with third-party applications. Users can create new microservices, configure API endpoints, and implement custom business logic to support automation and artificial intelligence capabilities. This modular approach improves application scalability, flexibility, and maintainability by allowing services to be developed, deployed, and managed independently.

3) DEPLOY(DESCRIPTIONS)

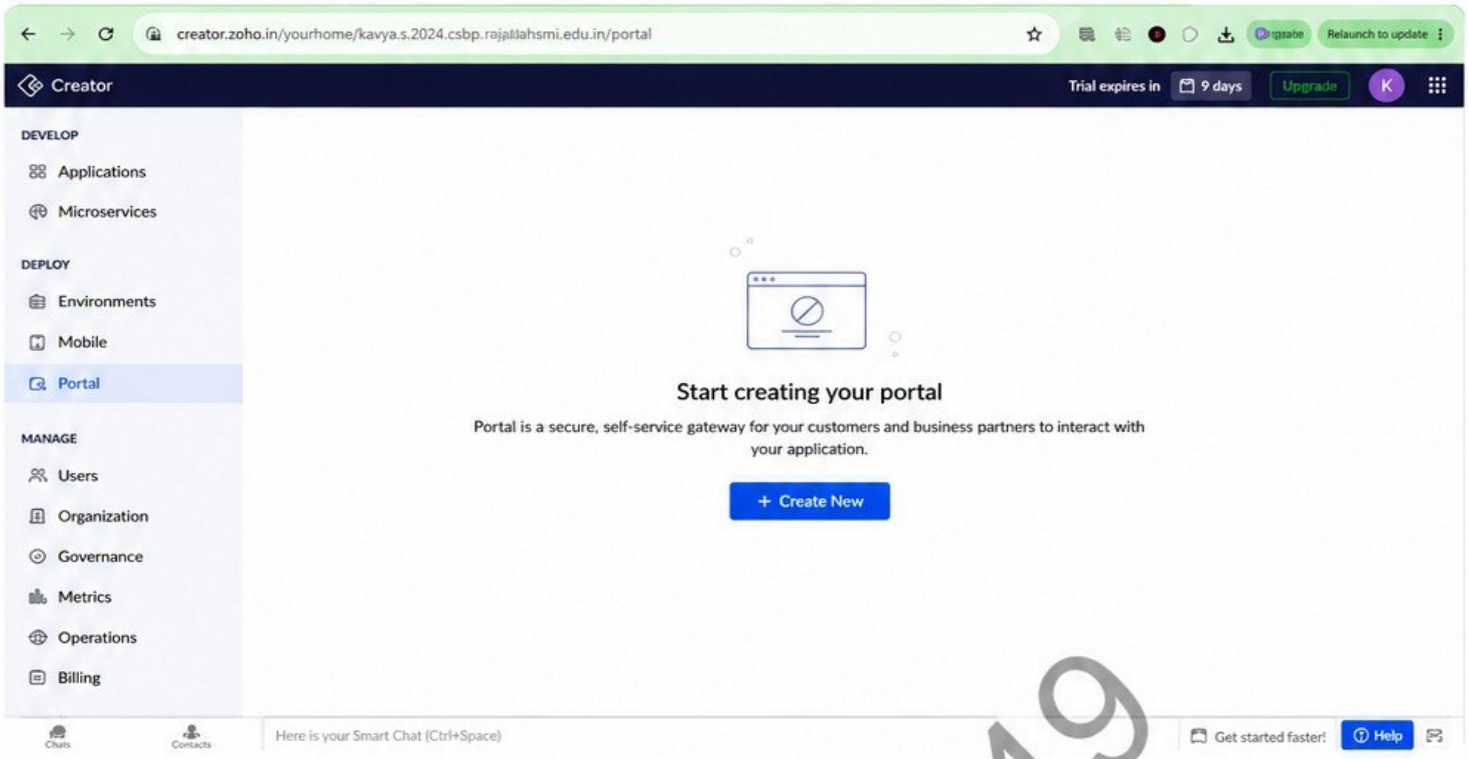

The **Environments** page in Zoho Creator provides a dedicated workspace for managing the deployment lifecycle of applications across different environments. It enables developers to move applications through multiple stages, such as **Development**, **Stage**, and **Production**, ensuring that new features and updates are thoroughly tested before being released to end users. The page allows users to add applications to specific environments, monitor deployment status, manage application versions, and publish updates without affecting the live production environment. This multi-stage deployment approach helps maintain application stability, minimizes deployment risks, and supports efficient version control.

24140104 9

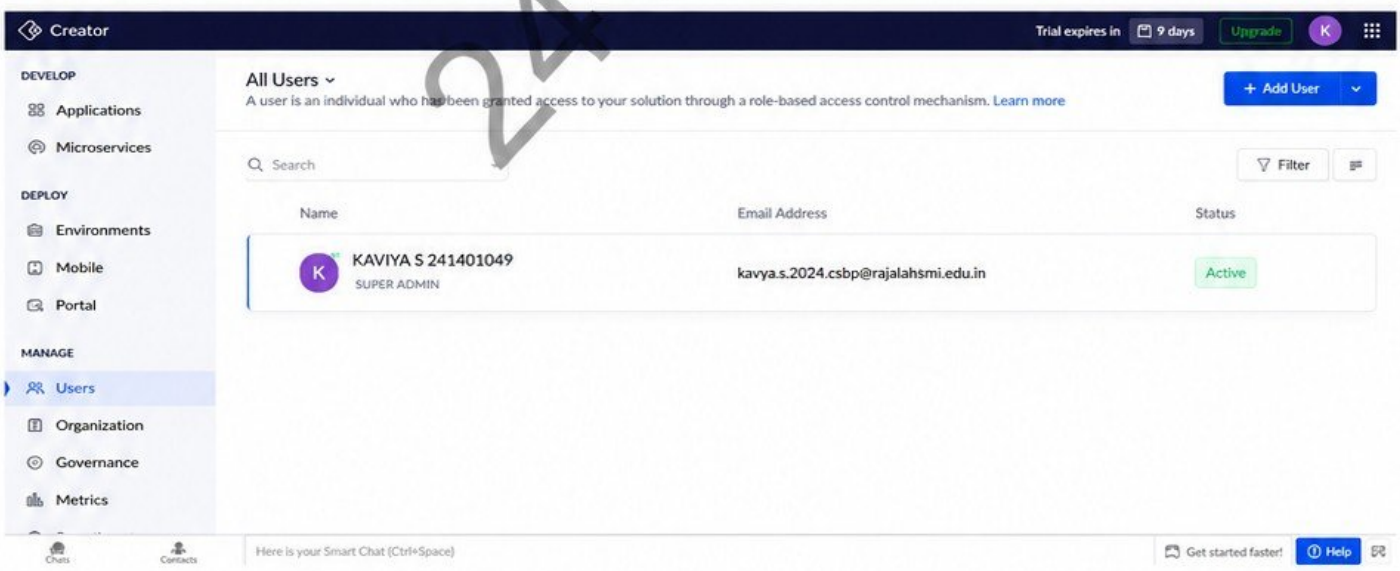

Mobile Deployment enables users to access the application seamlessly from smartphones and tablets, ensuring flexibility and convenience on the go. Through the mobile interface, users can perform essential tasks, view real-time data, receive instant notifications, and interact with the application anytime and anywhere. While advanced features such as white-labeled branded mobile apps require a premium subscription, the platform also provides a free branded mobile app for Android and iOS, allowing organizations to extend application accessibility without compromising functionality. This enhances productivity, improves user engagement, and supports remote access to business processes.

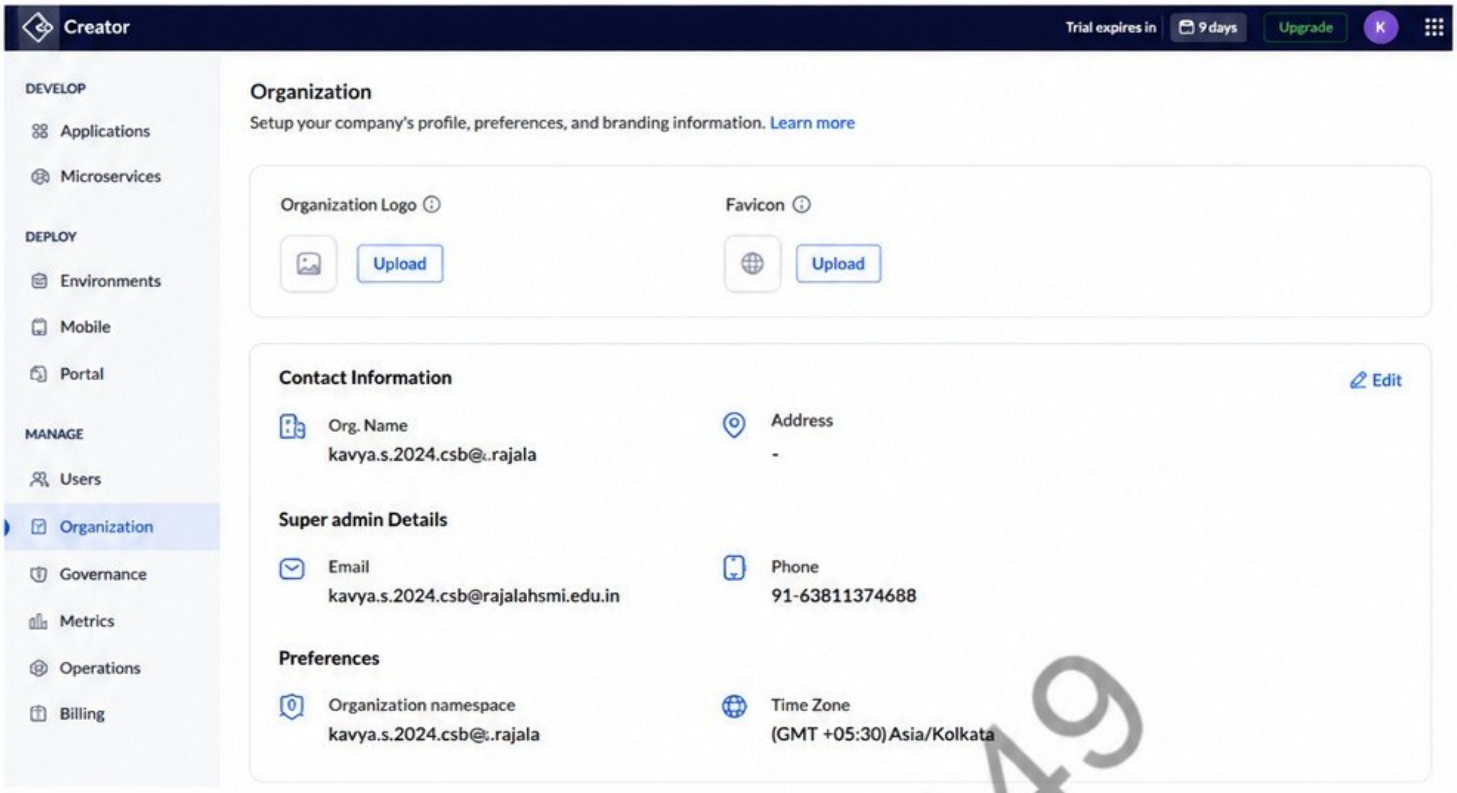

Portal provides a secure, self-service gateway that enables customers, clients, or business partners to interact directly with the application. Through the portal, external users can log in, submit forms, view and update their information, track requests, and access relevant data without requiring access to the internal application. This improves collaboration, enhances user experience, reduces administrative workload, and allows organizations to securely extend application services to external stakeholders through a centralized web interface.

4) MANAGE:(DESCRIPTIONS)

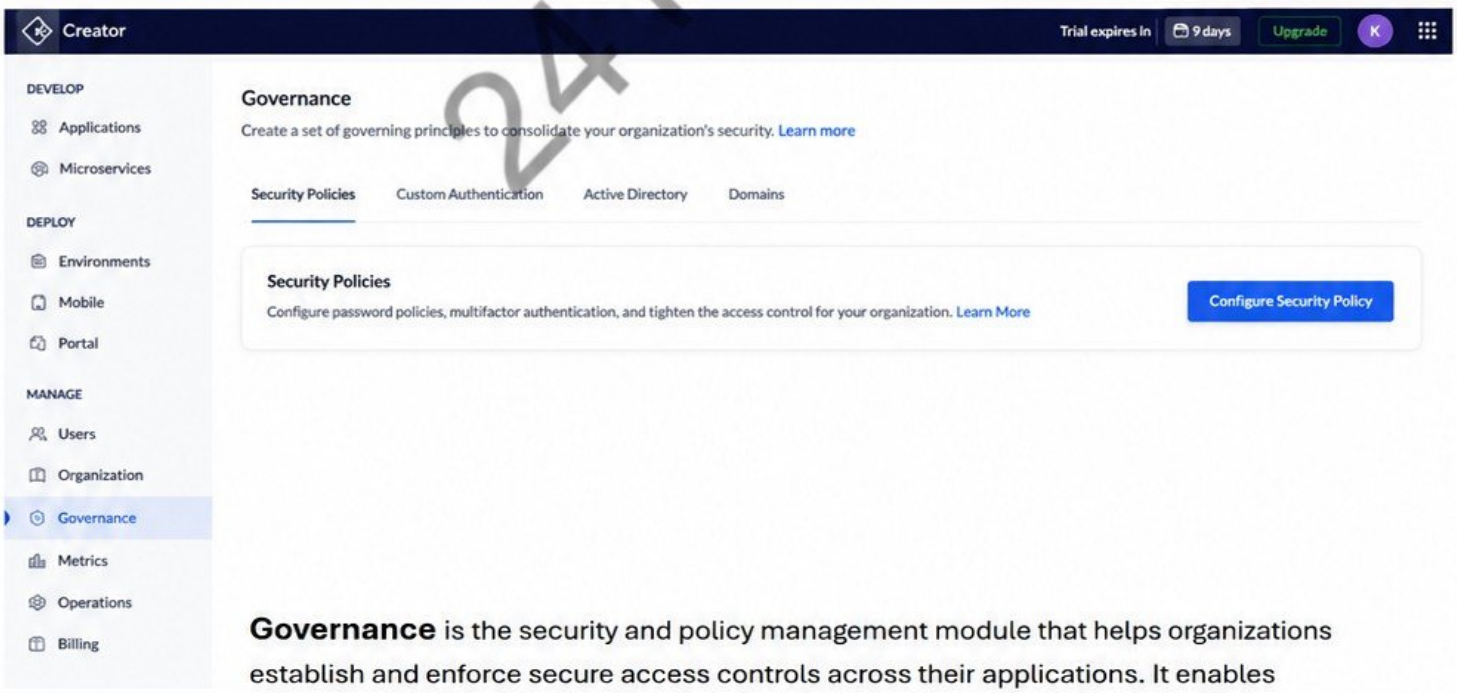

Users is the central access management module that allows administrators to add, manage, and monitor all users who can access the application. It supports role-based access control, enabling different permission levels such as administrators, managers, and end users to ensure secure access to application features and data. The module displays user details, email addresses, assigned roles, and account status, making it easy to manage active users, control permissions, and maintain a secure and organized user environment.

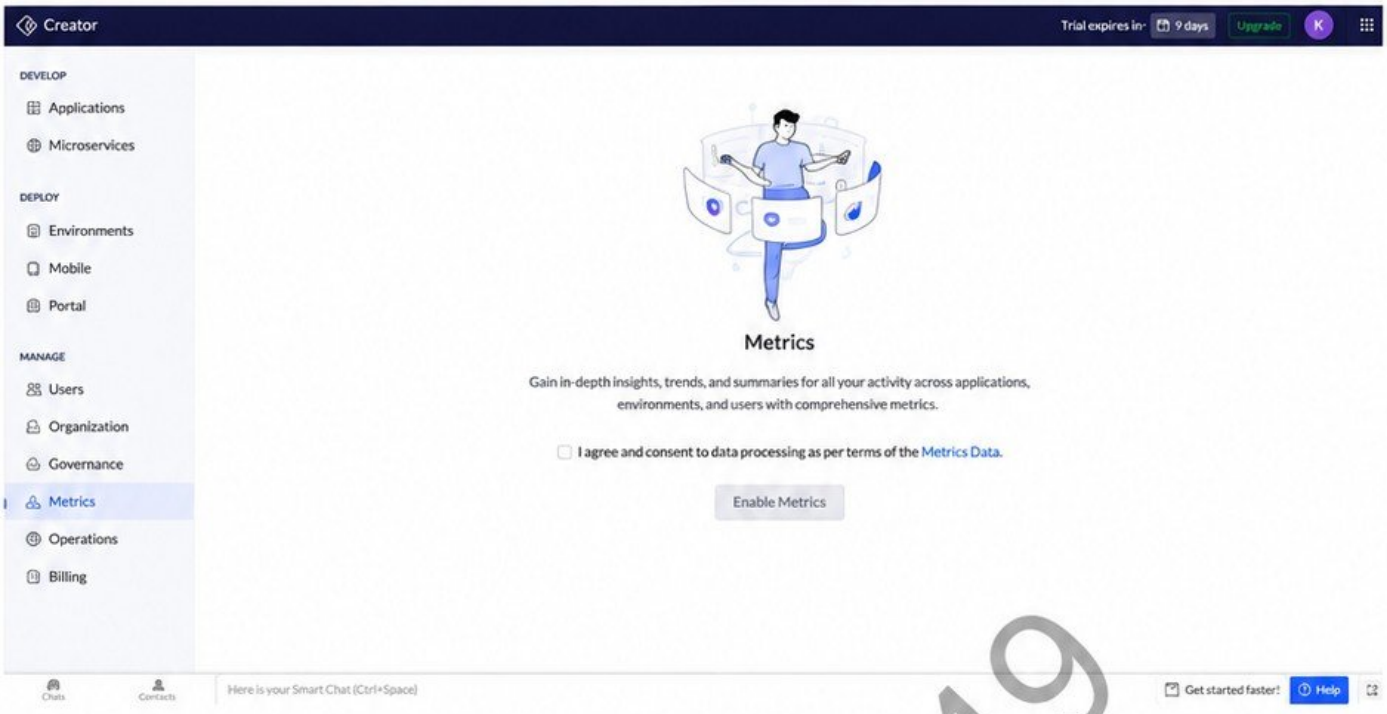

Organization is the configuration module used to manage the organization's profile, branding, and administrative settings. It allows administrators to upload the organization logo and favicon, maintain contact information, configure super administrator details, and set preferences such as the organization namespace and time zone. By centralizing these settings, the module ensures consistent branding, accurate organizational information, and standardized configurations across all applications, providing a secure and well-managed environment for users and administrators.

241401049

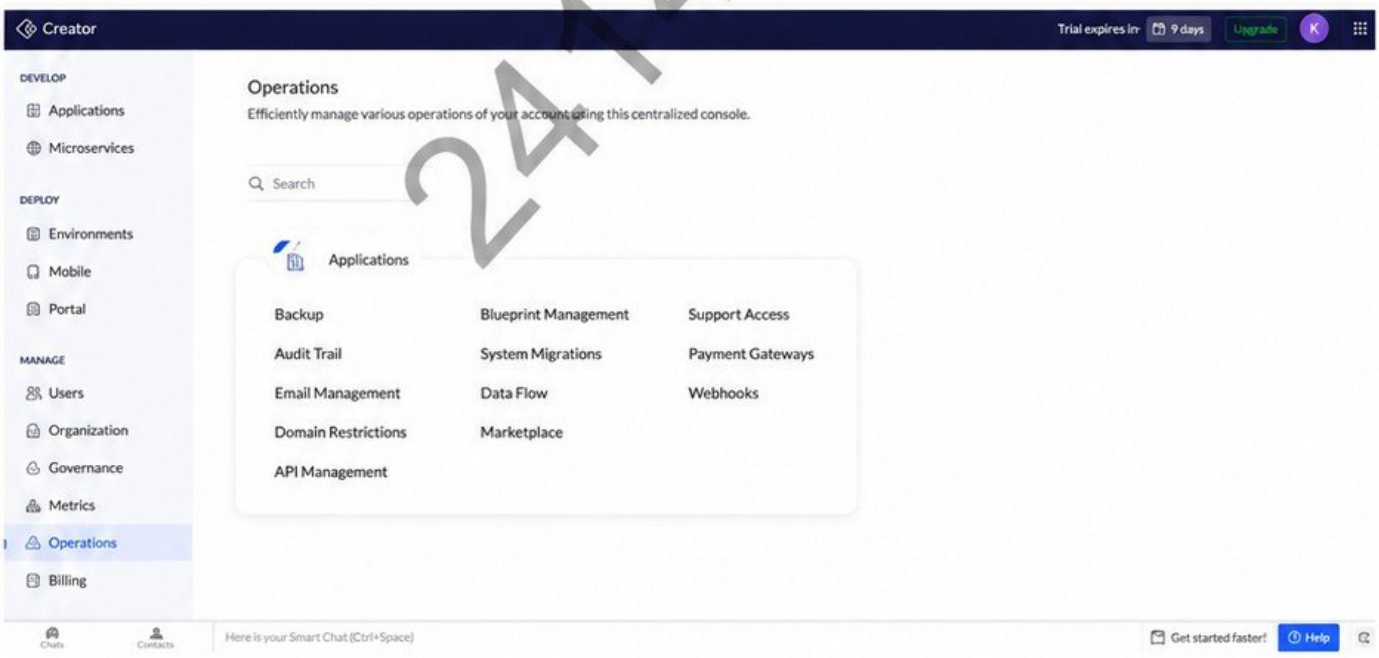

Governance is the security and policy management module that helps organizations establish and enforce secure access controls across their applications. It enables administrators to configure password policies, multi-factor authentication (MFA), custom authentication methods, Active Directory integration, and domain management to protect organizational resources. By centralizing security configurations and governance policies, this module enhances data protection, ensures compliance with organizational standards, and provides a secure environment for users while simplifying identity and access management.

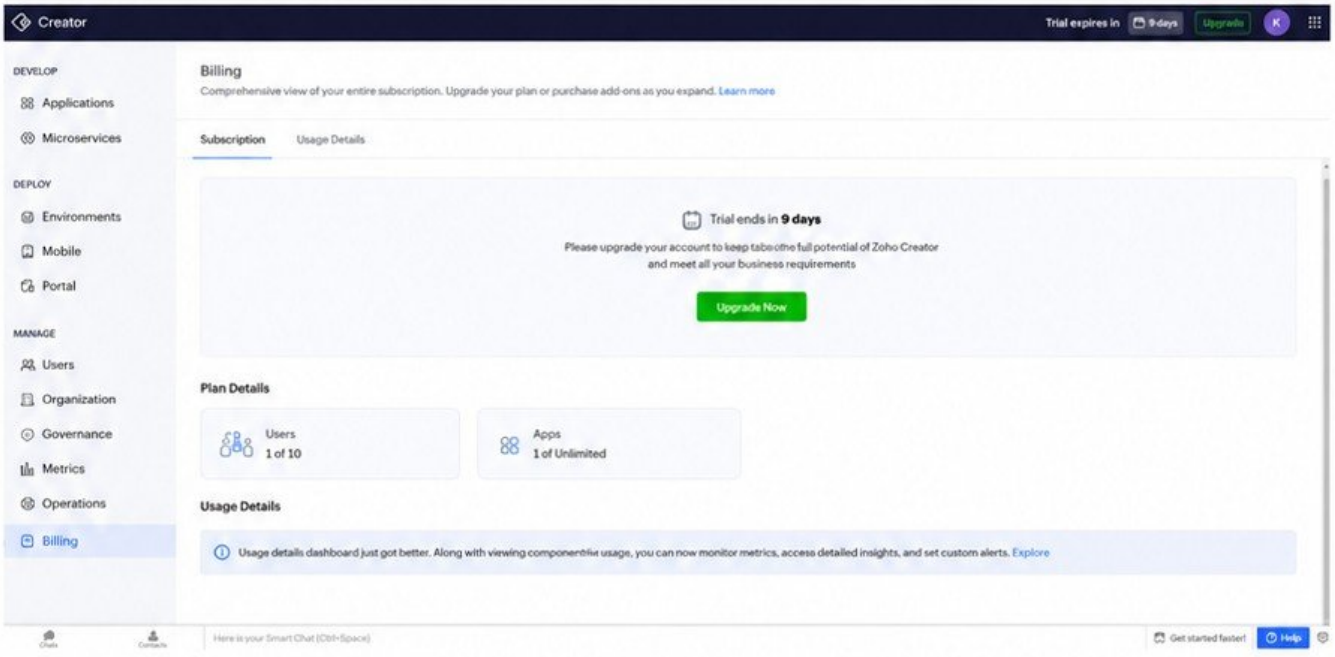

Metrics is the analytics and monitoring module that provides valuable insights into application usage, user activity, and overall system performance. It enables administrators to collect and analyze operational data, identify usage trends, detect anomalies, and monitor key performance indicators (KPIs) across applications. By offering real-time analytics and visual reports, the Metrics module supports informed decision-making, helps optimize application performance, and enhances the overall efficiency and reliability of the system.

24140949

Operations is the centralized administration module that enables administrators to manage and maintain various application and system-level operations from a single interface. It provides tools for backup and recovery, audit trails, log monitoring, email management, API management, application publishing, system integrations, payment gateways, and marketplace services. The module also supports analytics, domain restrictions, AI-powered assistance, and data integration features, ensuring efficient and secure management of the entire ecosystem.

application maintenance, secure operations, and streamlined administration while improving overall system reliability and performance.

Billing is the subscription and account management module that provides a comprehensive overview of the organization's licensing, plan details, and resource usage. It allows administrators to monitor subscription status, track trial periods, review usage details such as the number of users and applications, and upgrade plans or purchase additional services as business needs grow. By offering clear insights into account utilization and billing information, this module helps organizations effectively manage costs, optimize resource allocation, and ensure uninterrupted access to Zoho Creator services.
